

Name: StudioDesk

Description: StudioDesk is a project management website that will assist student teams of a fictional student consulting organization in managing their projects from start to finish. Outside organizations will be approved and submit projects. Student members will be assigned to teams where they can update projects and submit progress. Each project will contain relevant details like timeline, status, important info and updates, and more. The website's purpose is to provide an organized and structured way of handling multiple consulting projects / student engagements at once.

Page Names: Dashboard, Projects (only shows up for team members), Organizations / Clients, Teams, Submit (only shows up for org members), About

Data Stored: I will need to store information about organizations, teams, projects, and members. Organizations will have a name, industry, size, contact info, and members. Projects will have a title, description, scope, status, start date, due date, and hosting organization. Teams will have a name, target, capacity, and members. Members will have teams or organizations and personal information like name, account info, etc. Administrations, as said, will have edit, add, and delete capabilities, while other users (members) will have access to their teams/organizations and projects.
